Simplifying hemostasis.

For more information on Hemospray visit: hemospray.cookmedical.com
A different modality

What is Hemospray?
Hemospray is a proprietary mineral blend powder developed specifically for endoscopic Hemostasis. It contains no human or animal proteins or botanicals and has no known allergens. Hemospray is metabolically inert and deemed nontoxic, systemically or otherwise. Over the years, similar materials have been used by the military for topical battlefield hemostasis applications.

How does it work?
When Hemospray comes in contact with an actively bleeding site, the powder absorbs water, then acts both cohesively and adhesively, forming a mechanical barrier over the bleeding site.

“Hemospray achieved promising results in our initial pilot study. It appears to be a safe and effective hemostatic modality for the treatment of active peptic ulcer bleeds.”

Prof. Joseph Sung, Chinese University of Hong Kong, Hong Kong, China

Not for sale in the USA.
When to use Hemospray?

Hemospray is a different endoscopic modality that has demonstrated successful results in a wide range of nonvariceal upper GI hemostasis procedures.

Hemospray has also demonstrated successful results with these additional nonvariceal bleed types:

- Gastritis
- Mallory Weiss Tears
- Esophagitis
- Neoplasms
- Dieulafoy Lesions
- GAVE/Watermelon Stomach
- Gastric Angiodysplasia
- Post EMR

“I find this non contact hemostatic approach especially helpful when the bleeding is diffuse and the tissue fragile, such as in malignancies. I believe it is the most effective agent available today to produce immediate hemostasis.”

Alan Barkun, MD, McGill University, Montreal, Canada
A different approach to hemostasis

Hemospray, unlike traditional therapies, is a nonthermal, nontraumatic, noncontact modality that doesn’t require the precise targeting of other endoscopic devices. That means:

- **Nonthermal:** No tissue changes occur as sometimes experienced with thermal modalities.
- **Nontraumatic:** Since no force is applied at the treatment site, the powder minimizes the risk of tissue trauma as experienced with other modalities.
- **Noncontact:** Aerosol delivery system eliminates the need for direct mechanical or contact forces with the treatment site.
- **Nonspecific targeting:** Powder is sprayed toward the source of the bleed, so it does not require the en face approach and accuracy needed for conventional modalities.

Simplifying hemostasis for you and your patient

An ease of use comparison was made for 84 patient treatments in a postmarket clinical registry and Hemospray was determined to be comparable to or easier than administration of other hemostasis treatment modalities.

Hemostasis was achieved in under 10 minutes in over 70% of cases with Hemospray. Hemospray was thought to save time in 59% of cases (57/97).

“Hemospray is an important and novel therapy which offers an exciting new treatment option in patients at highest risk from bleeding lesions in the upper GI tract.”

**John Morris, MD**
**Glasgow Royal Infirmary, Glasgow, Scotland**

Contributors SEAL post market evaluation:
University of Manitoba, Winnipeg MT, St. Pauls Hospital, Vancouver BC, St. Michaels Hospital, Toronto ON, McGill University, Montreal QC, University Hospital Mainz, Germany, Queen Elizabeth Hospital, Birmingham, UK, Lund University Hospital, Malmo Sweden, Institute University Parc Tauli, Sabadell, Spain, Hvidovre Hospital, Copenhagen, Denmark, Hospital Cochin, Paris, France, Glasgow Royal Infirmary, Glasgow, Scotland, Erasmus Medical Center, Rotterdam, Netherlands, Ospedale San Paolo, Italy, Amsterdam Medical Center, Amsterdam Netherlands
Easy as One, Two, Three

In just three easy steps you can deploy Hemospray to treat nonvariceal upper GI bleeds. Simply activate the CO₂ cartridge, open the valve and spray toward the source of bleeding.

“We at the AMC are very satisfied with the initial results we have achieved with Hemospray and are excited to learn the true scope of this new technology.”

Prof. Jaques Bergman
Amsterdam Medical Center, Amsterdam, The Netherlands

Not for sale in the USA.
**Hemospray Reference Articles**

*Full article pending publication Journal of Clinical Gastroenterology. E-published December 2013.*

“Hemospray is an easy to use device which controls GI-bleedings immediately. It is my primary choice for acute upper GI bleeding. The bleeding site can be ideally judged after initial hemospray and the need for further interventions can be clarified.”

Prof. Ralf Kießlich, St. Marienkrankenhaus, Frankfurt, Germany
Product Specifications

Used for hemostasis of nonvariceal upper gastrointestinal bleeding.

This device is supplied sterile and is disposable - intended for single use only.
